

ConcealBrowse for SecOps

See why Security Operations Teams invest in ConcealBrowse to monitor and manage risks at the edge.

THE CONCEAL VALUE FOR SECURITY ANALYST

Security Operation teams are faced with constantly accumulating alerts - making the management of time to triage of the essence. Currently, SOC teams are dealing with alert fatigue, insufficient resources and complex telemetry.

To encourage timely and effective response, ConcealBrowse can minimize alerts generated from the edge. By filtering and isolating potentially malicious content, activities at the edge can be contained before an alert needs to be generated for the SOC team to triage - saving them time and allowing them to effectively triage other alerts in their organizations environment.

MINIMIZE ALERT FATIGUE

Allowing Conceal to manage security at the edge gives you the opportunity to focus on alerts that are generated elsewhere in your environment. With quicker insights for traffic at the edge and a simplified ability to change flows of traffic allowed, security operations teams can focus their time and attention elsewhere.

Quicker Insights

The admin dashboard has been overhauled to give immediate insight to key metrics for ConcealBrowse admins. Additionally, with customizable graph visualization functionality, admins can conduct a quick visual analysis of the data they are most interested in.

Control Enablement

Restrict the flow of information between safe and risky websites and operate within your preferred risk tolerance with ConcealBrowse. Additionally, bulk upload allow/block lists instead of having to manually enter them one-by-one, simplifying setup.

Post Processing Integration

Send telemetry data to a large number of networks security and analysis tools, seamlessly integrating into any tech stack.

Proactive Containment

By isolating potentially malicious web activity proactively, security analysts can focus on genuine alerts, knowing that if one is generated from the web, it is likely important to prioritize.
